## Wednesday Challenge Form

Group Members: Alyssa, Will, Yatra, Roy

Problem Statement: Find the average speed of a person sky diving with the given calculations.

Approach: We found a website that had a formula to find the terminal velocity. After, we calculated the time it takes the diver to hit terminal velocity and then we went back to basics to calculate miles per hour and divide that and then we found the answer. Hope this makes sense.

Solution: Calculate correctly

Lessons Learned: WE WON!!!!
